## T Cell Protocols (Methods in Molecular Biology)

This book is a collection of protocols, to provide novel techniques for the study of the biology of T lymphocytes. The methods described in this book do not cover all of the techniques currently used to study T cell-mediated immune responses for the simple reason that T cell immunology is probably the immunological discipline which can be investigated with the widest variety of approaches.

The choice of chapters was made taking into account two points: First, many of the techniques that have been used for some time have been upgraded during the past few years given the greater availability of a variety of products (i.e. cytokines, chemokines, monoclonal antibodies), of refined technical devices (i.e. novel cell culture and cell analysis equipments), and the development of novel instrumentation (i.e. multiparametric flow cytometers, confocal microscopes). Therefore, in several chapters “old techniques”, which remain fundamental to T cell immunology, are described in their “modern” versions. Secondly, the technical advancement has generated the possibility to establish novel assays to investigate T cell physiology. This is reflected in the chapters which describe the protocols that allow use of these modern approaches. The preparation of this book has required participation of several scientists, all leading experts in their respective fields. Without their enthusiastic participation, this work would not have been possible. Therefore, I thank all authors for their contributions and accept all criticism for missing parts, or information or details, for which only I am responsible. I hope these protocols will be useful for young investigators who approach for the first time the complex field of immunology and for those more experienced scientists who look for concise and efficacious descriptions of novel methods.
